

Kaagazz
Privacy by Design

SENSITIVE INFORMATION DISCOVERY

Kaagazz Discover

Know where sensitive information exists before risk remains hidden.

Kaagazz Discover helps organisations identify sensitive information across files, endpoints and repositories, surface risk and support continuous information governance.

THE OPERATING CHALLENGE

- Sensitive information spread across active and legacy locations
- Unclear visibility into files, shares and permissions
- Manual discovery exercises that become outdated quickly

Discover - Secure - Govern - Comply

Kaagazz is designed as a connected information-governance platform. Each product addresses a focused need while supporting a wider privacy-by-design journey.

Core capabilities

Broad file coverage	Scan common document, image, email, archive and text formats.
PII visibility	Identify configured personal and sensitive data patterns.
Repository context	Record locations, shares and relevant access information.
Continuous governance	Repeat discovery as data, systems and permissions change.

What this can help achieve

- A clearer inventory of sensitive information
- Prioritised findings for review and remediation
- A practical starting point for privacy and security controls
- Evidence to support accountable governance

A practical starting point	Start with a defined repository, department or information-risk question.
